                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide comprises one of the 5602
complementary strand of a polynucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide comprises a 5'-end
complementary strand of a polynucleotide of ending of the
complementary strand of a polynucleotide of ending of the comprises a 1'-end sequence of man be complementary to a
coligonucleotide comprises a 1'-end sequence of polynucleotide of the 5'-end sequence of the 6'-end sequence of the 5'-end sequence of the 5'-end sequence of the 6'-end sequence of 5'-end 5'-end sequence of 5'-end 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GLEWMGGIIPIFGTANYAQKFQGRVTITADESTSTAYMELSSLRSEDTAVYYCARDFF-- 122

This invention relates to a novel nucleic acids, and encoded polypeptides thereof, which have properties related to the stimulation of biochemical cor physiological responses in a cell, tissue, organ or organism.

Cor physiological responses in a cell, tissue, organ or organism.

Capecifically, it refers to the use of biologically active fragments for diagnostic and prognostic assays and furthermore in the treatment of diverse pathological conditions. The present invention describes novel thuman and murine NOVX proteins, as well as methods to modulate their expression using antisense oligos, ribozymes and peptide nucleic acids. The NOVX polypeptides, polynucleotides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer and diabetees. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune of disorders, allergies, blood disorders, acquired immunodeficiency syndrome of disorders, allergies, blood disorders, acquired immunodeficiency syndrome of disorders, allergies, manipully, these molecules have many activities including cycostatic, cardiant, antidiabetic, antiarteriosclerotic, anorectic, and epilepsy, complexepsy, antiarthritic, hapetotropy, antiarthritic, hapetotropy, antiarthritic, hapetotropy, antiparteriosclerotic, antiarthritic, neuroprotective, notropic, antiarthritic, hey are useful in screening creamant and anticonvulsant. In addition, they are useful in screening creample, assays to identify small molecules that modulate or inhibit, for example,

                                                                                                                                                The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% to 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or mothlo floates. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 318
                                                                                                                                                                                                                                                                                                                                                                                        258

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide provided in the special specification. Note: The sequence data for this patent did not form part from EPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                         830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GLEWMGGIIPIFGTAN-YAQKFQGRVTITADESTSTAYMBLSSLRSEDTAVYYCARDP-- 121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GLEWV-ALIWYDGTKTYYSDSVKGRLTVSRDNYKNTLYLEMKSLGAEDTAVYYCARDQGY 121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SGNTFRPEVHLLPPPSEELALNELVTLTCLARGFSPKDVLVRWLQGSQELPREKYLTWAS 421

This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to CDNA clones obtained by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as antibodies, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the CDNA molecules. As such, these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 1; SEQ ID NO 3755; 2686pp; English.

```
molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, neurological disease, Alzheimer's disease, Parkinson's disease, dementa, short memory and various cancers, as well as for maintaining equilibrium of sense or motor function, and for treating emotional reaction, fear response and panic. Accordingly, they exhibit osteopathic, neuroprotective, nootropic, antiparkinsonian, cytostatic and tranquiliser activities. This polypeptide is a protein encoded by a full length human cDNA sequence of the invention. NOTE: This sequence is not given in the sequence listing of the specification but can be obtained on CD-ROM from the European Patent Office, Vienna Sub-
             8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               osteopathic; neuroprotective; nootropic; antiparkinsonian; cytostatic; gene therapy; diagnostic marker; morbid state; osteoporosis; neurological disease; Alzheimer's disease; Parkinson's disease; dementia;
                                                                                                                 The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotide or as a probe for useful in gene therapy, for developing a diagnostic marker or medicines for regularing their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                       09

                                                                                                                                                                                                                The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% to 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, enerchological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein

AMILIOTO-AAH19250 represent CDNAs corresponding to 27 human secreted protein genes, and AAG62136-AAG62231 represent the protein fragments. The genes and their corresponding secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing. Treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 25 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of 25 genes, based on the tissues in which they are most highly expressed, abnormalities, haematopoietic disorders, diseases of the immune system, abnormalities, haematopoietic disorders, diseases of the immune system, allergies, neurological disorders, e.g., Alzheimer's disease.

AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders, e.g., Alzheimer's disease.

AIDS, autoimmune diseases, constrive disorders, schizophrenia, asthma, skin disorders and information disorders, and infections. The proteins can also be used to aid wound the cardiovascular disorders, angiogenic disorders, endecrine, construction organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their counture of primary tissues, to regenerate tissues, to identify their counture of primary tissues, to regenerate tissues, to identify their counture of primary tissues, to regenerate tissues, to identify their controlled above, and in diagnostic immunoassays e.g., radioimmunosassay or enzyme linked immunosabent assay (ELISA). The present sequence represents a human of the invention of the invention of the invention of invention of the invention of the invention of the invention of the invention of invention of the invention of the invention of the invention o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GDLYTTSSQLTLPATQCLAGKSVTCHVKHYTNPSQDVTVPCPVPSTPPTPSPFTPSP 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       203 GDLYTTSSQLTLPATQCLAGKSVTCHVKHYTNPSQDVTVPCPVPSTPPTPSPSTPPTPSP 262

The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, disestive disorders (e.g. Crohn's such as cancer, reproductive disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), heamaropojetic disorders, neural disorders (e.g. Alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningtis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG631326-ABG65518 represent albumin fusion proteins of the invention

the internation features to a movel abunant huston procesh the and procesh and a parameterizal carrier; a kit comprising the albumin fusion procesh and a parameterizal carrier; a kit comprising the composition of the and a parameterizal carrier; a kit comprising the composition of the and a parameterizal carrier; a kit comprising the composition of the and subnant fusion protein; a method of treating a patient with a disease or disorder that is modulated by Therapeutic protein; x, or its fragment or variant; a method of treating a patient with a disease or disorder that is modulated by Therapeutic protein; x, or its fragment or variant; a method of extending the shelf life of Therapeutic protein, x, or its fragment or variant; a method of extending the shelf life of Therapeutic protein; x, or its fragment or variant; and the patient of the albumin fusion protein. The albumin fusion protein of the albumin fusion protein. The albumin fusion protein and its compositions have the following comprising the nuclaic adid molecule of the albumin fusion protein. The albumin fusion protein and its compositions have the following a cutylines: cytostacic, antillapsenic, manipulated, antilarchythmic, cardiant, mootropic, antilipsenic, manipulatory, immunoadulator, antilarchythmic, cardiant, mootropic, antilipsenic, manipulatory, immunoadulator, antilarchythmic, cardiant, mootropic, antilipsenic, manipulatory, manipulatory, and vulnerary. The albumin fusion protein is useful for diagnosing, treating, manipulater, antilarchythmic, cardiant and vulnerary. The albumin fusion protein in useful for diagnosing, treating, manipulater, judgines or albumin fusion or haematopoleic diseases (e.g. anamenia, Hodgkin's disease, computational anament, militar and colon, bowel disease, proteintital, indiant or language in eprocedutive system diseases (e.g. giant cell lumours), and cardiac arrest, heat valve diseases (e.g. giant cell altumours), and cardiac arrest, heat valve diseases (e.g. district and disease, partitions or real diseases or The invention relates to a novel albumin fusion protein. The invention Disclosure; SEQ ID NO 302; 279pp; English. dowloaded from the USPTO website.

WPI; 2004-583265/57 N-PSDB; ADR06496 New 1995 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers.

Claim 1; SEQ ID NO 1958; 2686pp; English.

molecules and the encoded proteins thereof. Specifically, it refers to CDNA clones obtained by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as antibodies, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the CDNA molecules. As such, these molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, meurological disease, Alzheimer's disease, Parkinson's disease, short memory and various cancers, as well as for maintaining equilibrium of sense or motor function, and for treating emotional reaction, fear response and panic. Accordingly, they exhibit osteopathic, neuroprotective, nootropic, antiparkinsonian, cytostatic and tranquiliser activities. This polypeptide is a protein encoded by a full length human cDNA sequence of the invention. NOTE: This sequence is not given in the sequence listing of the specification but can be obtained on CD-ROM from the European Patent Office, Vienna Sub-This invention relates to novel, isolated full length human cDNA

Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide

of the polynucleotide, immunologically assaying the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide. The oligonucleotide or detecting the polynucleotide. The polynucleotide, or as a probe for detecting the polynucleotide. The polynucleotides and encoded proteins are useful as pharmaceutical agents and many disease-related genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell respectation. Membrane proteins, signal transduction-related proteins, transcription-related proteins, signal transduction-related proteins, cranscription-related proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumourer. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence date for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         444
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            264

                                                                                                                                                                                                                            The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% to 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteopromis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ALNELVILITCLARGFSPKDVLVRWLQGSQELPREKYLIWASRQEPSQGTTTFAVTSILRV 300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM013759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                216 GDLYTTSSQLTLPATQCLAGKSVTCHVKHYTNPSQDVTVPCPVPSTPPTPSPSTPPTPSP

The invention relates to an immunoadhesin comprising: (a) a chimeric intercellular adhesion molecule (ICAM)-1 comprising a rhinovirus receptor protein linked to at least a portion of an immunoglobulin heavy chain, and (b) optionally a J chain and secretory component associated with the cand (b) optionally a J chain and secretory component associated with the immunoadhesin has plant-specific glycosylation and virucide activity. The immunoadhesin is useful for reducing infection by human rhinovirus (HRV) and hence the intelation or spread of the common cold by HRV. The immunoadhesin binds to HRV and reducing infectionly, competing with call surface ICAM-1 for binding sites, interfering with virus entry or uncoating and directing premature classe of viral RNA and formation of empty capsids. Expression of the immunoadhesin having multiple binding sites have a higher effective affinity for the virus, thereby increasing the effectiveness of the immunoadhesin. Association of secretory component and immunoglobulin J chain increases the stability of the immunoadhesin in the mucosal conviconment. Production is significantly less expensive in plants than in animal cell culture and production in plants is safer for human use, since plants are not known to harbor any animal viruses. The present conviconment is that of a human immunoglobulin protein sequence, useful to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 GDLYTTSSQLTLPATQCLAGKSVTCHVKHYTNPSQDVTVPCPVPSTPPTPSPSTPPTPSP 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel immunoadhesin comprising a chimeric toxin receptor protein consisting of a toxin receptor protein linked to at least a portion of an immunoglobulin heavy chain with a J (joining) chain and secretory component (SC) associated with the chimeric toxin receptor protein. The immunoadhesin comprises a chimeric bacterial or viral toxin receptor protein and the immunoadhesin has plant-specific glycosylation. The immunoadhesin of the invention demonstrates virucide and antibacterial activities and may be useful for reducing the binding of a viral or bacterial antigen to a host cell and thus for treating or preventing anthrax, as well as human rhinovirus infection which results in the common cold. The current sequence is that of the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 ASPISPKVFPLSLCSTQPDGNVVIACLVQGFFPQEPLSVTWSESGQGVTARNFPPSQDAS

This sequence represents the protein encoded by a cancer-suppressor gene, which is down regulated in large intestine cancer. The gene is located on chromosome 14q22. The invention also relates to a vector comprising the gene, a host cell transformed by the vector, and a process for culturing the host cell and recovering the expression product. The gene, encoded polypeptide and antibody are used in the diagnosis and treatment of cancers particularly large intestine cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New immunoglobulin A polypeptide and encoding nucleic acid molecule, useful for diagnosing diabetic retinopathy using an immunologic method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to an immunoglobulin A polypeptide for diagnosing diabetic retinopathy. The composition and method are useful for diagnosing diabetic retinopathy. The present sequence represents immunoglobulin A heavy chain.
                                                                                                                                                                                                                       SCCHPRISLHRPALEDLILGSEANLTCTLTGLRDASGVTFTWTPSSGKSAVQGPPDRDLC

This invention relates to a novel nucleic acids, and encoded polypeptides thereof, which have properties related to the stimulation of biochemical cor physical responses in a cell, tissue, organ or organism.

Cor physicalogical responses in a cell, tissue, organ or organism.

Corpusationally, it refers to the use of biologically active fragments for diagonstic and prognostic sand furthermore in the treatment of diagonstic and prognostic says well as methods to modulate their expression using antisense oligos, riboxymes and peptide nucleic acids. The NOWX polypeptides, polymucleotides and antibodies are useful in treating or preventing NOWX-associated disorders, e.g. cardiomyopathy, atherosalerosis, cancer and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune consistingly, these modisorders, alteropathy, cirrhosis, arthritis, Alzheimer's disease, infections, stroke, muscular dystrophy and dispitapsy. Accordingly, these molecules have many activities including cytostatic, cardiant, antidiflammatory, immunosuppressive, antiallergic, haemostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, neuroprotective, nootropic, antiarthritic, hapatotropic, antiallergic, cellaxant and anticonvulsant. In addition, they are useful in screening casasys to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also the macogenomics. This polypeptide is a homologue of a human NOVX protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or

A;Note: this chain does not form a disulfide bond with the light chain
A;Note: the A2m(1) allotype appears to be a recombinant chain, being identical (except for Bur alpha-1 chain from positions 279 to 340
C;Comment: The A2m(2) allotype sequence of the myeloma protein But is shown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AyMap position: 14g32.33-14g32.33
C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kapp hain disulfade bonds. In some cases, such as IgA and IgM, the subunits associate into lan C;Superfamily: immunoglobulin C region; immunoglobulin homology civeramer; immunoglobulin homology c;Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin homology civeramer; interchain (to light chain) #status predicted F;109,169/Disulfide bonds: interchain (to alpha chain in another subunit) #status predicted F;339/Disulfide bonds: interchain (to J chain) #status predicted
A;Note: the disulfide bond formed by Cyg-77 is unaccounted for R;Tsuzukida, Y.; Wang, C.C.; Putnam, F.W.

                                                                                                                                                                                                                                                                                                                    A. Accession: A93857
A. Molecule type: protein
A. Molecule type: protein that of mouse MOPC 47A, and a genetic mechanism for A. Mote: this chain was isolated from a myeloma protein that binds phosphorylcholine
A. Note: the sequence is compared with that of mouse MOPC 47A, and a genetic mechanism for A. Mole: this chain was isolated from a myeloma protein that binds phosphorylcholine
C. Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into le C. Superfamally: immunoglobulin heterotetramer; immunoglobulin
